Gradient bounds for elliptic problems singular at the boundary

Tommaso Leonori

Granada, 24 de Enero 2012

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三■ - のへぐ

Let us consider the following class of second order Hamilton Jacobi equations:

$$-\alpha\,\Delta u + u + H(x,\nabla u) = 0 \quad \text{in }\Omega\,,$$

where Ω is a smooth (say C^2) bounded domain in \mathbb{R}^N , $N \ge 2$, $\alpha > 0$ and H(x, p) is a Caratheodory function.

Let us consider the following class of second order Hamilton Jacobi equations:

 $-\alpha\,\Delta u+u+H(x,\nabla u)=0\quad\text{in }\Omega\,,$

where Ω is a smooth (say C^2) bounded domain in \mathbb{R}^N , $N \ge 2$, $\alpha > 0$ and H(x, p) is a Caratheodory function.

We are interested in considering nonlinear Hamiltonians that are singular at the boundary.

うして 山田 マイボット ボット シックション

Let us consider the following class of second order Hamilton Jacobi equations:

 $-\alpha\,\Delta u+u+H(x,\nabla u)=0\quad\text{in }\Omega\,,$

where Ω is a smooth (say C^2) bounded domain in \mathbb{R}^N , $N \ge 2$, $\alpha > 0$ and H(x, p) is a Caratheodory function.

We are interested in considering nonlinear Hamiltonians that are singular at the boundary.

Our aim is to prove gradient bounds for such class of equations.

The interest on this kind of equations comes from a problem introduced by J.M. Lasry and P.L. Lions in a paper of 1989.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ のへぐ

The interest on this kind of equations comes from a problem introduced by J.M. Lasry and P.L. Lions in a paper of 1989.

They consider the following SDE

$$\left\{ egin{aligned} dX_t &= a_t dt + \sqrt{2} dB_t \,, \ X_0 &= x \in \Omega \,, \end{aligned}
ight.$$

where B_t is the Brownian motion, and $a \in C^0(\Omega, \mathbb{R}^N)$ represents the control.

The interest on this kind of equations comes from a problem introduced by J.M. Lasry and P.L. Lions in a paper of 1989.

They consider the following SDE

$$\left\{ egin{aligned} dX_t &= a_t dt + \sqrt{2} dB_t \,, \ X_0 &= x \in \Omega \,, \end{aligned}
ight.$$

where B_t is the Brownian motion, and $a \in C^0(\Omega, \mathbb{R}^N)$ represents the control.

"We want to constrain a Brownian motion in a given domain Ω by controlling its drift".

Are there controls that keep the process inside Ω for any time?

$$a(x) \cdot \nu(x) < 0$$
 $x \sim \partial \Omega$.

Indeed we have $(\nabla d(x) = -\nu(x))$

$$\frac{d}{dt}d(x(t)) = \dot{x}(t)\nabla d(x) = -a(x(t))\cdot\nu(x) > 0,$$

i.e. the distance to the boundary growths, as x(t) get close the boundary.

Indeed a bounded control, near the boundary of Ω , cannot contrast the diffusion due to the Brownian motion.

Indeed a bounded control, near the boundary of Ω , cannot contrast the diffusion due to the Brownian motion.

Indeed let τ_x be the first exit time from Ω , thus $\mathbb{E}(\tau_x) = v(x)$ solves

$$\begin{cases} -\Delta v - a \cdot \nabla v = 1 & \text{in } \Omega, \\ v = 0 & \text{on } \partial \Omega, \end{cases}$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

Indeed a bounded control, near the boundary of Ω , cannot contrast the diffusion due to the Brownian motion.

Indeed let τ_x be the first exit time from Ω , thus $\mathbb{E}(\tau_x) = v(x)$ solves

$$\begin{cases} -\Delta v - a \cdot \nabla v = 1 & \text{in } \Omega, \\ v = 0 & \text{on } \partial \Omega, \end{cases}$$

and thus if *a* is bounded there exists a unique solution *v* bounded and $\mathbb{E}(\tau_x) \leq ||v||_{\infty}$.

Indeed a bounded control, near the boundary of Ω , cannot contrast the diffusion due to the Brownian motion.

Indeed let τ_x be the first exit time from Ω , thus $\mathbb{E}(\tau_x) = v(x)$ solves

$$\begin{cases} -\Delta v - a \cdot \nabla v = 1 & \text{in } \Omega, \\ v = 0 & \text{on } \partial \Omega, \end{cases}$$

and thus if *a* is bounded there exists a unique solution *v* bounded and $\mathbb{E}(\tau_x) \leq ||v||_{\infty}$.

Typical examples of controls are constructed as functions of the distance to the boundary, that are singular at the boundary itself, i.e.

$$a(x) \sim \psi(d(x))$$
 with $\lim_{d(x) \to 0} |\psi(x)| = +\infty$.

Motivated by such type of problems, we are mainly interested in nonlinear Hamiltonians H(x, p) where a sort of "linearization" (I will give more details later) lets appear a singular field.

Motivated by such type of problems, we are mainly interested in nonlinear Hamiltonians H(x, p) where a sort of "linearization" (I will give more details later) lets appear a singular field.

This field has a privileged direction which reminds of the control mechanism acting basically in the normal direction.

Let v be a solution of

$$-\Delta v + v + H(x, \nabla v) = f$$
 in Ω

H and f smooth.

We want to find an (upper) bound for $|\nabla v|^2$ by looking at the equation that it solves.

The equation involves the laplacian, so the first step is to write $\Delta |\nabla v|^2$.

$$\partial_{x_i} |\nabla v|^2 = \partial_{x_i} \sum_{k=1}^N v_k^2 = \sum_{k=1}^N 2v_k v_{ki}$$

$$\partial_{x_i x_i} |\nabla v|^2 = \sum_{k=1}^N 2v_k v_{kii} + 2v_{ki} v_{ki} = 2 \sum_{k=1}^N v_k (v_{ii})_k + v_{ki}^2.$$

$$\partial_{x_ix_i}|\nabla v|^2 = 2\sum_{k=1}^N v_k(v_{ii})_k + v_{ki}^2,$$

・ロト・4日ト・4日ト・日 りへで

$$\partial_{x_i x_i} |\nabla v|^2 = 2 \sum_{k=1}^N v_k (v_{ii})_k + v_{ki}^2,$$

it means, when we sum with respect to *i*,

$$\Delta |\nabla v|^2 = 2 \nabla v \cdot \nabla \Delta v + 2 |D^2 v|^2$$
.

$$\partial_{x_ix_i}|\nabla v|^2 = 2\sum_{k=1}^N v_k(v_{ii})_k + v_{ki}^2,$$

it means, when we sum with respect to *i*,

$$\Delta |
abla v|^2 = 2
abla v \cdot
abla \Delta v + 2|D^2 v|^2$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

Thus the expression of the laplacian of $|\nabla v|^2$ involves the gradient of the laplacian of *v*.

$$\partial_{x_ix_i}|
abla v|^2=2\sum_{k=1}^N v_k(v_{ii})_k+v_{ki}^2,$$

it means, when we sum with respect to *i*,

$$\Delta |\nabla v|^2 = 2 \nabla v \cdot \nabla \Delta v + 2 |D^2 v|^2$$

Thus the expression of the laplacian of $|\nabla v|^2$ involves the gradient of the laplacian of *v*.

So we have to use the equation solved by *v*:

$$-\Delta \mathbf{v} + \mathbf{v} + H(\mathbf{x}, \nabla \mathbf{v}) = f$$

$$\partial_{x_ix_i}|\nabla v|^2=2\sum_{k=1}^N v_k(v_{ii})_k+v_{ki}^2,$$

it means, when we sum with respect to *i*,

$$\Delta |\nabla v|^2 = 2\nabla v \cdot \nabla \Delta v + 2|D^2 v|^2$$

Thus the expression of the laplacian of $|\nabla v|^2$ involves the gradient of the laplacian of *v*.

So we have to use the equation solved by *v*:

$$\Delta v = v + H(x, \nabla v) - f$$

$$\Delta |\nabla v|^2 = 2\nabla v \cdot \nabla (\Delta v) + 2|D^2 v|^2,$$

and *v* satisfies $\Delta v = v - f$.

$$\Delta |\nabla v|^2 = 2\nabla v \cdot \nabla (\Delta v) + 2|D^2 v|^2,$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ のへぐ

and *v* satisfies $\Delta v = v - f$. Thus dropping the second (positive) term on the right hand side, we deduce

$$\Delta |\nabla v|^2 \geq 2 |\nabla v|^2 - 2\nabla v \cdot \nabla f$$

$$\Delta |\nabla v|^2 = 2\nabla v \cdot \nabla (\Delta v) + 2|D^2 v|^2,$$

and *v* satisfies $\Delta v = v - f$. Thus dropping the second (positive) term on the right hand side, we deduce

$$\Delta |\nabla v|^2 \geq 2 |\nabla v|^2 - 2 \nabla v \cdot \nabla f \geq |\nabla v|^2 - \|\nabla f\|_{\infty}^2.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ のへぐ

$$\Delta |\nabla v|^2 = 2\nabla v \cdot \nabla (\Delta v) + 2|D^2 v|^2,$$

and *v* satisfies $\Delta v = v - f$. Thus dropping the second (positive) term on the right hand side, we deduce

$$\Delta |\nabla v|^2 \ge 2 |\nabla v|^2 - 2\nabla v \cdot \nabla f \ge |\nabla v|^2 - \|\nabla f\|_{\infty}^2.$$

Hence $|\nabla v|^2$ is a subsolution for

$$-\Delta w + w = \|\nabla f\|^2.$$

If $|\nabla v|^2$ has an interior maximum point, thus it is bounded by the square of the norm of *f*.

$$\Delta |\nabla v|^2 = 2\nabla v \cdot \nabla (\Delta v) + 2|D^2 v|^2,$$

and *v* satisfies $\Delta v = v - f$. Thus dropping the second (positive) term on the right hand side, we deduce

$$\Delta |\nabla v|^2 \geq 2 |\nabla v|^2 - 2\nabla v \cdot \nabla f \geq |\nabla v|^2 - \|\nabla f\|_{\infty}^2.$$

Hence $|\nabla v|^2$ is a subsolution for

$$-\Delta w + w = \|\nabla f\|^2.$$

If $|\nabla v|^2$ has an interior maximum point, thus it is bounded by the square of the norm of *f*. Hence

$$\sup_{\overline{\Omega}} |\nabla v|^2 \le \|\nabla f\|^2 + \sup_{\partial \Omega} |\nabla v|^2$$

where

- $B(x) \in W^{1,\infty}(\Omega)^N$,
- ► $d(x) \in C^2(\Omega)$, $d \equiv dist(x, \partial \Omega)$ near $\partial \Omega$ and $\nabla d = -\nu$ at $\partial \Omega$,
- c(x) ∈ W^{1,∞}(Ω), without any sign condition!
 i.e. the hamiltonian H(x, p) is not coercive with respect to |p|;

$$(E_{\alpha})$$
 $-\alpha\Delta u + u + \frac{B(x)\cdot\nabla u}{d(x)} + c(x)|\nabla u|^2 = f(x)$ in Ω ,

where

- $B(x) \in W^{1,\infty}(\Omega)^N$,
- ► $d(x) \in C^2(\Omega)$, $d \equiv dist(x, \partial \Omega)$ near $\partial \Omega$ and $\nabla d = -\nu$ at $\partial \Omega$,
- c(x) ∈ W^{1,∞}(Ω), without any sign condition!
 i.e. the hamiltonian H(x, p) is not coercive with respect to |p|;

•
$$f(x) \in W^{1,\infty}_{\text{loc}}(\Omega)$$
, possibly singular at $\partial \Omega$.

Theorem (T.L., A. Porretta - ARMA 2011)

Let $c(x) \in W^{1,\infty}(\Omega)$, $B(x) \in W^{1,\infty}(\Omega)^N$ with

$$B(x) \cdot \nu \ge \sigma > 0, \quad B(x) \cdot \tau = 0 \qquad at \ \partial \Omega$$

and $\sigma > \alpha$ and assume that $f(x) \in W^{1,\infty}_{loc}(\Omega)$ satisfies near the boundary

$$|f| \leq rac{
ho(d)}{d}, \quad |
abla f| \leq rac{
ho(d)}{d^2} \qquad ext{where } \int_0^1 rac{
ho(s)}{s} \, ds < \infty \, .$$

Then there exists a solution u of (E_{α}) in $u \in C^{2}(\Omega) \cap W^{1,\infty}(\Omega)$.

Theorem (T.L., A. Porretta - ARMA 2011)

Let $c(x) \in W^{1,\infty}(\Omega)$, $B(x) \in W^{1,\infty}(\Omega)^N$ with

$$B(x) \cdot \nu \ge \sigma > 0, \quad B(x) \cdot \tau = 0 \qquad at \ \partial \Omega$$

and $\sigma > \alpha$ and assume that $f(x) \in W^{1,\infty}_{loc}(\Omega)$ satisfies near the boundary

$$|f| \leq rac{
ho(d)}{d}\,, \quad |
abla f| \leq rac{
ho(d)}{d^2} \qquad ext{where } \int_0^1 rac{
ho(s)}{s}\,ds < \infty\,.$$

Then there exists a solution u of (E_{α}) in $u \in C^{2}(\Omega) \cap W^{1,\infty}(\Omega)$. Moreover u is the unique bounded solution and $\frac{\partial u(x)}{\partial \nu} \to 0$ as $x \to \partial \Omega$.

Theorem (T.L., A. Porretta - ARMA 2011)

Let $c(x) \in W^{1,\infty}(\Omega)$, $B(x) \in W^{1,\infty}(\Omega)^N$ with

$$B(x) \cdot \nu \ge \sigma > 0$$
, $B(x) \cdot \tau = 0$ at $\partial \Omega$

and $\sigma > \alpha$ and assume that $f(x) \in W^{1,\infty}_{loc}(\Omega)$ satisfies near the boundary

$$|f| \leq rac{
ho(d)}{d}, \quad |
abla f| \leq rac{
ho(d)}{d^2} \qquad ext{where } \int_0^1 rac{
ho(s)}{s} \, ds < \infty \, .$$

Then there exists a solution u of (E_{α}) in $u \in C^{2}(\Omega) \cap W^{1,\infty}(\Omega)$. Moreover u is the unique bounded solution and $\frac{\partial u(x)}{\partial \nu} \to 0$ as $x \to \partial \Omega$.

For $\alpha = \sigma$ the same result holds true under stronger hypothesis on ρ , namely

$$\int_0^1 \frac{1}{s} \left(\int_0^s \frac{\rho(\tau)}{\tau} d\tau \right) ds < \infty.$$

First, we approximate our equation in order to "desingularize" it, with solutions that satisfy a Neumann boundary condition at the interior of Ω ,

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

First, we approximate our equation in order to "desingularize" it, with solutions that satisfy a Neumann boundary condition at the interior of Ω , namely:

$$\begin{cases} -\alpha \Delta u_n + u_n + \frac{B(x) \cdot \nabla u_n}{d(x)} + c(x) |\nabla u_n|^2 = f(x) & \text{in } \Omega_n \,, \\ \frac{\partial u_n}{\partial \nu} = 0 & \text{on } \partial \Omega_n \,, \end{cases}$$

where $\Omega_n = \{x \in \Omega : d(x) > \frac{1}{n}\}.$

First, we approximate our equation in order to "desingularize" it, with solutions that satisfy a Neumann boundary condition at the interior of Ω , namely:

$$\begin{cases} -\alpha \Delta u_n + u_n + \frac{B(x) \cdot \nabla u_n}{d(x)} + c(x) |\nabla u_n|^2 = f(x) & \text{in } \Omega_n \,, \\ \frac{\partial u_n}{\partial \nu} = 0 & \text{on } \partial \Omega_n \,, \end{cases}$$

where $\Omega_n = \{x \in \Omega : d(x) > \frac{1}{n}\}.$

We focus our attention on the function

$$w_n = |\nabla u_n|^2 e^{\theta(d)}$$

where θ is a bounded function (but its first derivative, in general, is singular at d(x) = 0).

 $\nabla u_n \cdot \nu = 0$ on $\partial \Omega_n$

$$\nabla u_n \cdot \nu = 0$$
 on $\partial \Omega_n$

implies that there exists a function μ such that

$$\mu(x) \nu(x) = \nabla (\nabla u_n \cdot \nu(x)) = D^2 u_n \nu(x) + J(\nu(x)) \nabla u_n \quad \text{on } \partial \Omega_n.$$

$$\nabla u_n \cdot \nu = 0$$
 on $\partial \Omega_n$

implies that there exists a function μ such that

$$\mu(\mathbf{x}) \ \nu(\mathbf{x}) = \nabla \big(\nabla u_n \cdot \nu(\mathbf{x}) \big) = D^2 u_n \ \nu(\mathbf{x}) + J(\nu(\mathbf{x})) \ \nabla u_n \qquad \text{on } \partial \Omega_n \,.$$

Thus in the direction of ∇u_n we have

$$\mu(x) \ \nu(x) \cdot \nabla u_n = D^2 u_n \ \nu(x) \cdot \nabla u_n + J(\nu(x)) \ \nabla u_n \cdot \nabla u_n \quad \text{on } \partial \Omega_n \,.$$

$$abla u_n \cdot \nu = 0$$
 on $\partial \Omega_n$

implies that there exists a function μ such that

$$\mu(x) \ \nu(x) = \nabla \big(\nabla u_n \cdot \nu(x) \big) = D^2 u_n \ \nu(x) + J(\nu(x)) \ \nabla u_n \qquad \text{on } \partial \Omega_n \,.$$

Thus in the direction of ∇u_n we have (using the Neumann condition)

$$\mu(x) \underbrace{\nu(x) \cdot \nabla u_n}_{=0} = D^2 u_n \, \nu(x) \cdot \nabla u_n + J(\nu(x)) \, \nabla u_n \cdot \nabla u_n \quad \text{on } \partial \Omega_n,$$
$$abla u_n \cdot \nu = 0$$
 on $\partial \Omega_n$

implies that there exists a function μ such that

$$\mu(x) \nu(x) = \nabla (\nabla u_n \cdot \nu(x)) = D^2 u_n \nu(x) + J(\nu(x)) \nabla u_n \quad \text{on } \partial \Omega_n.$$

Thus in the direction of ∇u_n we have (using the Neumann condition)

$$\mu(x) \underbrace{\nu(x) \cdot \nabla u_n}_{=0} = D^2 u_n \, \nu(x) \cdot \nabla u_n + J(\nu(x)) \, \nabla u_n \cdot \nabla u_n \quad \text{on } \partial \Omega_n,$$

$$\mathbf{0} = \frac{1}{2} \nabla |\nabla u_n|^2 \cdot \nu(\mathbf{x}) - D^2 d(\mathbf{x}) \nabla u_n \cdot \nabla u_n \quad \text{on } \partial \Omega_n,$$

$$abla u_n \cdot \nu = 0$$
 on $\partial \Omega_n$

implies that there exists a function μ such that

$$\mu(x) \nu(x) = \nabla (\nabla u_n \cdot \nu(x)) = D^2 u_n \nu(x) + J(\nu(x)) \nabla u_n \quad \text{on } \partial \Omega_n.$$

Thus in the direction of ∇u_n we have (using the Neumann condition)

$$\mu(x) \underbrace{\nu(x) \cdot \nabla u_n}_{=0} = D^2 u_n \, \nu(x) \cdot \nabla u_n + J(\nu(x)) \, \nabla u_n \cdot \nabla u_n \quad \text{on } \partial \Omega_n,$$

$$\mathbf{0} = \frac{1}{2} \nabla |\nabla u_n|^2 \cdot \nu(x) - D^2 d(x) \nabla u_n \cdot \nabla u_n \quad \text{on } \partial \Omega_n,$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ のへぐ

 $|\nabla |\nabla u_n|^2 \cdot \nu \leq 2 \|D^2 d\| \|\nabla u_n\|^2$ on $\partial \Omega_n$.

 $\nabla u_n \cdot \nu = 0$ on $\partial \Omega_n$

implies that there exists a function $\mu(x)$ such that

$$\mu(\mathbf{x}) \ \nu(\mathbf{x}) = \nabla \big(\nabla u_n \cdot \nu(\mathbf{x}) \big) = D^2 u_n \ \nu(\mathbf{x}) + D \nu(\mathbf{x}) \ \nabla u_n \qquad \text{on } \partial \Omega_n \,.$$

Thus in the direction of ∇u_n we have (using the Neumann condition)

 $|\nabla |\nabla u_n|^2 \cdot \nu \leq 2 \|D^2 d\| \|\nabla u_n\|^2$ on $\partial \Omega_n$.

 $\nabla u_n \cdot \nu = 0$ on $\partial \Omega_n$

implies that there exists a function $\mu(x)$ such that

$$\mu(\mathbf{x}) \ \nu(\mathbf{x}) = \nabla \big(\nabla u_n \cdot \nu(\mathbf{x}) \big) = D^2 u_n \ \nu(\mathbf{x}) + D \nu(\mathbf{x}) \ \nabla u_n \qquad \text{on } \partial \Omega_n \,.$$

Thus in the direction of ∇u_n we have (using the Neumann condition)

 $|\nabla |\nabla u_n|^2 \cdot \nu \leq 2 \|D^2 d\| \|\nabla u_n\|^2$ on $\partial \Omega_n$.

Thus it is easy to see that on $\partial \Omega_n$,

$$\begin{aligned} \nabla w_n \cdot \nu &= \nabla \Big(|\nabla u_n|^2 e^{\theta(d)} \Big) \cdot \nu &= -\theta'(d) w_n + e^{\theta(d)} |\nabla v_n|^2 \cdot \nu \\ &\leq -\theta'(d) w_n + 2 \|D^2 d\| e^{\theta(d)} |\nabla u_n|^2 \end{aligned}$$

 $\nabla u_n \cdot \nu = 0$ on $\partial \Omega_n$

implies that there exists a function $\mu(x)$ such that

$$\mu(\mathbf{x}) \ \nu(\mathbf{x}) = \nabla \big(\nabla u_n \cdot \nu(\mathbf{x}) \big) = D^2 u_n \ \nu(\mathbf{x}) + D \nu(\mathbf{x}) \ \nabla u_n \qquad \text{on } \partial \Omega_n \,.$$

Thus in the direction of ∇u_n we have (using the Neumann condition)

 $|\nabla |\nabla u_n|^2 \cdot \nu \leq 2 \|D^2 d\| \|\nabla u_n\|^2$ on $\partial \Omega_n$.

Thus it is easy to see that on $\partial \Omega_n$,

$$\nabla w_n \cdot \nu = \nabla \left(|\nabla u_n|^2 e^{\theta(d)} \right) \cdot \nu = -\theta'(d) w_n + e^{\theta(d)} \nabla |\nabla u_n|^2 \cdot \nu$$

$$\leq -\theta'(d) w_n + 2 \|D^2 d\| \underbrace{e^{\theta(d)} |\nabla u_n|^2}_{w_n}$$

 $\nabla u_n \cdot \nu = 0$ on $\partial \Omega_n$

implies that there exists a function $\mu(x)$ such that

$$\mu(\mathbf{x}) \ \nu(\mathbf{x}) = \nabla \big(\nabla u_n \cdot \nu(\mathbf{x}) \big) = D^2 u_n \ \nu(\mathbf{x}) + D \nu(\mathbf{x}) \ \nabla u_n \qquad \text{on } \partial \Omega_n \,.$$

Thus in the direction of ∇u_n we have (using the Neumann condition)

 $|\nabla |\nabla u_n|^2 \cdot \nu \leq 2 \|D^2 d\| \|\nabla u_n\|^2$ on $\partial \Omega_n$.

Thus it is easy to see that on $\partial \Omega_n$,

$$\nabla w_n \cdot \nu = \nabla \Big(|\nabla u_n|^2 e^{\theta(d)} \Big) \cdot \nu = -\theta'(d) w_n + e^{\theta(d)} \nabla |\nabla u_n|^2 \cdot \nu$$

$$\leq -\theta'(d) w_n + 2 ||D^2 d|| \underbrace{e^{\theta(d)} |\nabla u_n|^2}_{w_n} < 0$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

 $\nabla u_n \cdot \nu = 0$ on $\partial \Omega_n$

implies that there exists a function $\mu(x)$ such that

$$\mu(\mathbf{x}) \ \nu(\mathbf{x}) = \nabla \big(\nabla u_n \cdot \nu(\mathbf{x}) \big) = D^2 u_n \ \nu(\mathbf{x}) + D \nu(\mathbf{x}) \ \nabla u_n \qquad \text{on } \partial \Omega_n \,.$$

Thus in the direction of ∇u_n we have (using the Neumann condition)

 $|\nabla |\nabla u_n|^2 \cdot \nu \leq 2 \|D^2 d\| \|\nabla u_n\|^2$ on $\partial \Omega_n$.

Thus it is easy to see that on $\partial \Omega_n$,

$$\begin{aligned} \nabla w_n \cdot \nu &= \nabla \Big(|\nabla u_n|^2 e^{\theta(d)} \Big) \cdot \nu &= -\theta'(d) w_n + e^{\theta(d)} |\nabla \nabla u_n|^2 \cdot \nu \\ &\leq -\theta'(d) w_n + 2 \|D^2 d\| \underbrace{e^{\theta(d)} |\nabla u_n|^2}_{w_n} < 0 \end{aligned}$$

Thus (Hopf Lemma) the maximum of w_n is not achieved at the boundary of Ω_n .

Step 2. Near $\partial \Omega$.

$$\theta(\boldsymbol{s}) = \int_0^{\boldsymbol{s}} \frac{\rho(\sigma)}{\sigma} d\sigma$$

where, we recall $\frac{\rho(\sigma)}{\sigma}$ is integrable (i.e. $\rho(0) = 0, \rho > 0$).

$$\alpha \Delta w_n \ge 2\alpha \theta'(d) \nabla w_n \cdot \nabla d + \frac{\underline{B}(x) \cdot \nabla w_n}{d} + \underbrace{(\sigma - \alpha)}_{>0} \frac{\rho(d)}{d^2} (1 + o(1)) w_n - \underbrace{2 |\nabla u_n| |\nabla f| e^{\theta(d)}}_{\ge -\frac{(\sigma - \alpha)}{2} w_n \frac{\rho(d)}{d^2} - C_0 \frac{\rho(d)}{d^2}}$$

since $|\nabla f| \leq \frac{\rho(d)}{d^2}$

$$\theta(\boldsymbol{s}) = \int_0^{\boldsymbol{s}} \frac{\rho(\sigma)}{\sigma} d\sigma$$

where, we recall $\frac{\rho(\sigma)}{\sigma}$ is integrable (i.e. $\rho(0) = 0, \rho > 0$).

$$-\alpha \Delta w_n + 2\alpha \theta'(d) \nabla w_n \cdot \nabla d + \frac{B(x) \cdot \nabla w_n}{d} + \frac{(\sigma - \alpha)}{2} \frac{\rho(d)}{d^2} w_n \leq C_0 \frac{\rho(d)}{d^2}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三■ - のへぐ

$$\theta(\boldsymbol{s}) = \int_0^{\boldsymbol{s}} \frac{\rho(\sigma)}{\sigma} d\sigma$$

where, we recall $\frac{\rho(\sigma)}{\sigma}$ is integrable (i.e. $\rho(0) = 0, \, \rho > 0$).

$$-\alpha \Delta w_n + 2\alpha \theta'(d) \nabla w_n \cdot \nabla d + \frac{B(x) \cdot \nabla w_n}{d} + \frac{(\sigma - \alpha)}{2} \frac{\rho(d)}{d^2} w_n \leq C_0 \frac{\rho(d)}{d^2}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三■ - のへぐ

Thus on the interior maximum points $w_n \leq \frac{2}{(\sigma-\alpha)}C_0$.

$$\theta(\boldsymbol{s}) = \int_0^{\boldsymbol{s}} \frac{\rho(\sigma)}{\sigma} d\sigma$$

where, we recall $\frac{\rho(\sigma)}{\sigma}$ is integrable (i.e. $\rho(0) = 0, \, \rho > 0$).

$$-\alpha \Delta w_n + 2\alpha \theta'(d) \nabla w_n \cdot \nabla d + \frac{B(x) \cdot \nabla w_n}{d} + \frac{(\sigma - \alpha)}{2} \frac{\rho(d)}{d^2} w_n \leq C_0 \frac{\rho(d)}{d^2}.$$

Thus on the interior maximum points $w_n \leq \frac{2}{(\sigma-\alpha)}C_0$. This implies

$$\sup_{\overline{\Omega}_n \setminus \Omega_{\delta}} |\nabla u_n|^2 \leq \widetilde{C_0} + \sup_{\partial \Omega_{\delta}} |\nabla u_n|^2 \,.$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三■ - のへぐ

$$w_n = |\nabla u_n|^2 e^{\theta(d)} (1 + \beta(u_n))$$

where β is a suitable smooth, positive bounded function (computations in this case are much more heavy).

$$w_n = |\nabla u_n|^2 e^{\theta(d)} (1 + \beta(u_n))$$

where β is a suitable smooth, positive bounded function (computations in this case are much more heavy). The advantage of taking this function is that when we compute the laplacian of w_n there appears a term that involves

$$\alpha \Delta w_n = \dots + |\nabla u_n|^2 e^{\theta(d)} \Delta (1 + \beta(u_n)) + \dots$$

$$w_n = |\nabla u_n|^2 e^{\theta(d)} (1 + \beta(u_n))$$

where β is a suitable smooth, positive bounded function (computations in this case are much more heavy). The advantage of taking this function is that when we compute the laplacian of w_n there appears a term that involves

 $\Delta w_n = \dots + |\nabla u_n|^2 e^{\theta(d)} [\beta'(u_n) \Delta u_n + \beta''(u_n) |\nabla u_n|^2] + \dots$

Tedious computations yield to

$$\sup_{\overline{\Omega}\setminus\Omega_{\delta}}|\nabla u_{n}|^{2}\leq C+\sup_{\partial\Omega_{\delta}}|\nabla u_{n}|^{2}\,.$$

$$w_n = |\nabla u_n|^2 e^{\theta(d)} (1 + \beta(u_n))$$

where β is a suitable smooth, positive bounded function (computations in this case are much more heavy). The advantage of taking this function is that when we compute the laplacian of w_n there appears a term that involves

$$\Delta w_n = \dots + |\nabla u_n|^2 e^{\theta(d)} [\beta'(u_n) \Delta u_n + \beta''(u_n) |\nabla u_n|^2] + \dots$$

Tedious computations yield to

$$\sup_{\overline{\Omega}\setminus\Omega_{\delta}}|\nabla u_{n}|^{2}\leq C+\sup_{\partial\Omega_{\delta}}|\nabla u_{n}|^{2}\,.$$

Step 3. Interior estimate. By classical elliptic regularity ([GT]):

$$\forall \mathcal{K} \subset \subset \Omega, \quad \sup_{\mathcal{K}} |\nabla u_n|^2 \leq C (\text{dist} (\mathcal{K}, \partial \Omega)).$$

$$w_n = |\nabla u_n|^2 e^{\theta(d)} (1 + \beta(u_n))$$

where β is a suitable smooth, positive bounded function (computations in this case are much more heavy). The advantage of taking this function is that when we compute the laplacian of w_n there appears a term that involves

$$\Delta w_n = \dots + |\nabla u_n|^2 e^{\theta(d)} [\beta'(u_n) \Delta u_n + \beta''(u_n) |\nabla u_n|^2] + \dots$$

Tedious computations yield to

$$\sup_{\overline{\Omega}\setminus\Omega_{\delta}}|\nabla u_{n}|^{2}\leq C+\sup_{\partial\Omega_{\delta}}|\nabla u_{n}|^{2}\,.$$

Step 3. Interior estimate. By classical elliptic regularity ([GT]):

$$\forall \mathcal{K} \subset \subset \Omega, \quad \sup_{\mathcal{K}} |\nabla u_n|^2 \leq C (\text{dist} (\mathcal{K}, \partial \Omega)).$$

Thus we deduce that

$$\exists c > 0 : |\nabla u_n|^2 \leq c \quad \text{in } \Omega.$$

Uniqueness

うして 山田 マイボット ボット シックション

then uniqueness holds for solutions such that $u = o(|\varphi|)$.

In the case of equation (E_{α}) it holds with $\varphi \sim \log(d)$.

This is consequence of a classical principle that is well known in the linear case.

If $\exists \varphi \in C^2(\Omega)$ such that

$$\begin{cases} -\alpha \Delta \varphi + \varphi + H(x, \nabla \varphi) \leq \mathbf{0} & \text{ in } \Omega, \\ \varphi = -\infty & \text{ on } \Omega, \end{cases}$$

then uniqueness holds for solutions such that $u = o(|\varphi|)$.

In the case of equation (E_{α}) it holds with $\varphi \sim \log(d)$.

Thus bounded solutions are unique!

Let *u* be a solution of (E_{α}) and let us define $u_{\varepsilon} = (1 + \varepsilon)u - \varepsilon \varphi$.
$$-\alpha \Delta u_{\varepsilon} + u_{\varepsilon} + H(x, \nabla u_{\varepsilon})$$

= $(1 + \varepsilon) (-\alpha \Delta u + u) - \varepsilon (-\alpha \Delta \varphi + \varphi) + H(x, \nabla u_{\varepsilon}).$

$$\begin{aligned} &-\alpha\Delta u_{\varepsilon}+u_{\varepsilon}+\mathcal{H}(x,\nabla u_{\varepsilon})\\ &=(1+\varepsilon)\left(-\alpha\Delta u+u\right)-\varepsilon\left(-\alpha\Delta\varphi+\varphi\right)+\mathcal{H}(x,\nabla u_{\varepsilon})\,.\end{aligned}$$

Since $\nabla u = \frac{1}{1+\varepsilon} \nabla u_{\varepsilon} + \frac{\varepsilon}{1+\varepsilon} \nabla \varphi$ using that $H(x, \cdot)$ is convex, we have $H(x, \nabla u_{\varepsilon}) \ge (1+\varepsilon)H(x, \nabla u) - \varepsilon H(x, \nabla \varphi)$

$$\begin{aligned} &-\alpha \Delta u_{\varepsilon} + u_{\varepsilon} + \mathcal{H}(x, \nabla u_{\varepsilon}) \\ &= (1+\varepsilon) \left(-\alpha \Delta u + u \right) - \varepsilon \left(-\alpha \Delta \varphi + \varphi \right) + \mathcal{H}(x, \nabla u_{\varepsilon}) \,. \end{aligned}$$

Since $\nabla u = \frac{1}{1+\varepsilon} \nabla u_{\varepsilon} + \frac{\varepsilon}{1+\varepsilon} \nabla \varphi$ using that $H(x, \cdot)$ is convex, we have

$$H(x, \nabla u_{\varepsilon}) \geq (1 + \varepsilon)H(x, \nabla u) - \varepsilon H(x, \nabla \varphi)$$

and thus $-\alpha \Delta u_{\varepsilon} + u_{\varepsilon} + H(x, \nabla u_{\varepsilon}) \ge 0$. (u_{ε} is a super, $u_{\varepsilon} \to +\infty$ at $\partial \Omega$)

$$-\alpha\Delta u_{\varepsilon} + u_{\varepsilon} + H(x, \nabla u_{\varepsilon})$$

= $(1 + \varepsilon)(-\alpha\Delta u + u) - \varepsilon(-\alpha\Delta\varphi + \varphi) + H(x, \nabla u_{\varepsilon}).$

Since $\nabla u = \frac{1}{1+\varepsilon} \nabla u_{\varepsilon} + \frac{\varepsilon}{1+\varepsilon} \nabla \varphi$ using that $H(x, \cdot)$ is convex, we have

$$H(x, \nabla u_{\varepsilon}) \geq (1 + \varepsilon)H(x, \nabla u) - \varepsilon H(x, \nabla \varphi)$$

and thus $-\alpha \Delta u_{\varepsilon} + u_{\varepsilon} + H(x, \nabla u_{\varepsilon}) \ge 0$. $(u_{\varepsilon} \text{ is a super, } u_{\varepsilon} \to +\infty \text{ at } \partial \Omega)$ Let v be any subsolution of (E_{α}) such that $v = o(\varphi)$ as $d(x) \to 0$. We define $z_{\varepsilon} = u_{\varepsilon} - v$,

$$\begin{aligned} &-\alpha \Delta u_{\varepsilon} + u_{\varepsilon} + \mathcal{H}(x, \nabla u_{\varepsilon}) \\ &= (1+\varepsilon) \left(-\alpha \Delta u + u \right) - \varepsilon \left(-\alpha \Delta \varphi + \varphi \right) + \mathcal{H}(x, \nabla u_{\varepsilon}) \,. \end{aligned}$$

Since $\nabla u = \frac{1}{1+\varepsilon} \nabla u_{\varepsilon} + \frac{\varepsilon}{1+\varepsilon} \nabla \varphi$ using that $H(x, \cdot)$ is convex, we have

$$H(x, \nabla u_{\varepsilon}) \geq (1 + \varepsilon)H(x, \nabla u) - \varepsilon H(x, \nabla \varphi)$$

and thus $-\alpha \Delta u_{\varepsilon} + u_{\varepsilon} + H(x, \nabla u_{\varepsilon}) \ge 0$. $(u_{\varepsilon} \text{ is a super, } u_{\varepsilon} \to +\infty \text{ at } \partial \Omega)$ Let *v* be any subsolution of (E_{α}) such that $v = o(\varphi)$ as $d(x) \to 0$. We define $z_{\varepsilon} = u_{\varepsilon} - v$, then

$$-\alpha\Delta z_{\varepsilon}+z_{\varepsilon}+H(x,\nabla u_{\varepsilon})-H(x,\nabla v)\geq 0.$$

・ロト ・ 戸 ・ ・ ヨ ・ ・ ヨ ・ うへつ

$$\begin{aligned} &-\alpha \Delta u_{\varepsilon} + u_{\varepsilon} + \mathcal{H}(x, \nabla u_{\varepsilon}) \\ &= (1+\varepsilon) \left(-\alpha \Delta u + u \right) - \varepsilon \left(-\alpha \Delta \varphi + \varphi \right) + \mathcal{H}(x, \nabla u_{\varepsilon}) \,. \end{aligned}$$

Since $\nabla u = \frac{1}{1+\varepsilon} \nabla u_{\varepsilon} + \frac{\varepsilon}{1+\varepsilon} \nabla \varphi$ using that $H(x, \cdot)$ is convex, we have

$$H(x, \nabla u_{\varepsilon}) \geq (1 + \varepsilon)H(x, \nabla u) - \varepsilon H(x, \nabla \varphi)$$

and thus $-\alpha \Delta u_{\varepsilon} + u_{\varepsilon} + H(x, \nabla u_{\varepsilon}) \ge 0$. $(u_{\varepsilon} \text{ is a super, } u_{\varepsilon} \to +\infty \text{ at } \partial\Omega)$ Let *v* be any subsolution of (E_{α}) such that $v = o(\varphi)$ as $d(x) \to 0$. We define $z_{\varepsilon} = u_{\varepsilon} - v$, then

$$-\alpha\Delta z_{\varepsilon}+z_{\varepsilon}+H(x,\nabla u_{\varepsilon})-H(x,\nabla v)\geq 0.$$

Since z_{ε} blows-up at the boundary, there exists (at least) one point x_0 such that z_{ε} achieves its minimum in x_0 ;

$$-\alpha \Delta u_{\varepsilon} + u_{\varepsilon} + H(x, \nabla u_{\varepsilon})$$

= $(1 + \varepsilon) (-\alpha \Delta u + u) - \varepsilon (-\alpha \Delta \varphi + \varphi) + H(x, \nabla u_{\varepsilon}).$

Since $\nabla u = \frac{1}{1+\varepsilon} \nabla u_{\varepsilon} + \frac{\varepsilon}{1+\varepsilon} \nabla \varphi$ using that $H(x, \cdot)$ is convex, we have

$$H(x,\nabla u_{\varepsilon}) \geq (1+\varepsilon)H(x,\nabla u) - \varepsilon H(x,\nabla \varphi)$$

and thus $-\alpha \Delta u_{\varepsilon} + u_{\varepsilon} + H(x, \nabla u_{\varepsilon}) \ge 0$. $(u_{\varepsilon} \text{ is a super, } u_{\varepsilon} \to +\infty \text{ at } \partial\Omega)$ Let *v* be any subsolution of (E_{α}) such that $v = o(\varphi)$ as $d(x) \to 0$. We define $z_{\varepsilon} = u_{\varepsilon} - v$, then

$$-\alpha\Delta z_{\varepsilon}+z_{\varepsilon}+H(x,\nabla u_{\varepsilon})-H(x,\nabla v)\geq 0.$$

Since z_{ε} blows-up at the boundary, there exists (at least) one point x_0 such that z_{ε} achieves its minimum in x_0 ; u_{ε} and v are smooth, then $\Delta z_{\varepsilon}(x_0) \ge 0$ and $\nabla z_{\varepsilon}(x_0) = 0$ (i.e. $\nabla u_{\varepsilon}(x_0) = \nabla v(x_0)$).

$$z_{\varepsilon} \geq 0$$

$$-\alpha \Delta u_{\varepsilon} + u_{\varepsilon} + H(x, \nabla u_{\varepsilon})$$

= $(1 + \varepsilon)(-\alpha \Delta u + u) - \varepsilon (-\alpha \Delta \varphi + \varphi) + H(x, \nabla u_{\varepsilon}).$

Since $\nabla u = \frac{1}{1+\varepsilon} \nabla u_{\varepsilon} + \frac{\varepsilon}{1+\varepsilon} \nabla \varphi$ using that $H(x, \cdot)$ is convex, we have

$$H(x, \nabla u_{\varepsilon}) \geq (1 + \varepsilon)H(x, \nabla u) - \varepsilon H(x, \nabla \varphi)$$

and thus $-\alpha \Delta u_{\varepsilon} + u_{\varepsilon} + H(x, \nabla u_{\varepsilon}) \ge 0$. $(u_{\varepsilon} \text{ is a super, } u_{\varepsilon} \to +\infty \text{ at } \partial\Omega)$ Let *v* be any subsolution of (E_{α}) such that $v = o(\varphi)$ as $d(x) \to 0$. We define $z_{\varepsilon} = u_{\varepsilon} - v$, then

$$-\alpha\Delta z_{\varepsilon}+z_{\varepsilon}+H(x,\nabla u_{\varepsilon})-H(x,\nabla v)\geq 0.$$

Since z_{ε} blows-up at the boundary, there exists (at least) one point x_0 such that z_{ε} achieves its minimum in x_0 ; u_{ε} and v are smooth, then $\Delta z_{\varepsilon}(x_0) \ge 0$ and $\nabla z_{\varepsilon}(x_0) = 0$ (i.e. $\nabla u_{\varepsilon}(x_0) = \nabla v(x_0)$).

$$z_{\varepsilon} \geq 0 \quad \Rightarrow \quad u_{\varepsilon} \geq v$$

$$-\alpha \Delta u_{\varepsilon} + u_{\varepsilon} + H(x, \nabla u_{\varepsilon})$$

= $(1 + \varepsilon)(-\alpha \Delta u + u) - \varepsilon (-\alpha \Delta \varphi + \varphi) + H(x, \nabla u_{\varepsilon}).$

Since $\nabla u = \frac{1}{1+\varepsilon} \nabla u_{\varepsilon} + \frac{\varepsilon}{1+\varepsilon} \nabla \varphi$ using that $H(x, \cdot)$ is convex, we have

$$H(x, \nabla u_{\varepsilon}) \geq (1 + \varepsilon)H(x, \nabla u) - \varepsilon H(x, \nabla \varphi)$$

and thus $-\alpha \Delta u_{\varepsilon} + u_{\varepsilon} + H(x, \nabla u_{\varepsilon}) \ge 0$. $(u_{\varepsilon} \text{ is a super, } u_{\varepsilon} \to +\infty \text{ at } \partial\Omega)$ Let *v* be any subsolution of (E_{α}) such that $v = o(\varphi)$ as $d(x) \to 0$. We define $z_{\varepsilon} = u_{\varepsilon} - v$, then

$$-\alpha\Delta z_{\varepsilon}+z_{\varepsilon}+H(x,\nabla u_{\varepsilon})-H(x,\nabla v)\geq 0.$$

Since z_{ε} blows-up at the boundary, there exists (at least) one point x_0 such that z_{ε} achieves its minimum in x_0 ; u_{ε} and v are smooth, then $\Delta z_{\varepsilon}(x_0) \ge 0$ and $\nabla z_{\varepsilon}(x_0) = 0$ (i.e. $\nabla u_{\varepsilon}(x_0) = \nabla v(x_0)$).

$$z_{\varepsilon} \geq 0 \quad \Rightarrow \quad u_{\varepsilon} \geq v \quad \Rightarrow \quad u \geq v$$

This statement can be very useful as a regularity result.

Any bounded solution of (E_{α}) is $W^{1,\infty}(\Omega)$.

This statement can be very useful as a regularity result.

Any bounded solution of (E_{α}) is $W^{1,\infty}(\Omega)$.

Notice that this result of uniqueness/regularity holds true without knowing any information on the solution at the boundary!

This statement can be very useful as a regularity result.

Any bounded solution of (E_{α}) is $W^{1,\infty}(\Omega)$.

Notice that this result of uniqueness/regularity holds true without knowing any information on the solution at the boundary!

Since the solution belongs to $W^{1,\infty}(\Omega)$, there exists the trace at $\partial\Omega$ ad thus, for any $x_0 \in \partial\Omega$ we can rescale the equation near the boundary, we make a blow-up and it follows that the solution satisfies

$$\lim_{x\to x_0\in\partial\Omega}\frac{\partial u(x)}{\partial\nu}=0\,.$$

This statement can be very useful as a regularity result.

Any bounded solution of (E_{α}) is $W^{1,\infty}(\Omega)$.

Notice that this result of uniqueness/regularity holds true without knowing any information on the solution at the boundary!

Since the solution belongs to $W^{1,\infty}(\Omega)$, there exists the trace at $\partial\Omega$ ad thus, for any $x_0 \in \partial\Omega$ we can rescale the equation near the boundary, we make a blow-up and it follows that the solution satisfies

$$\lim_{x\to x_0\in\partial\Omega}\frac{\partial u(x)}{\partial\nu}=0\,.$$

This in particular means that the homogeneous Neumann boundary condition is intrinsic in the equation.

Optimality of $\sigma \geq \alpha$: the Fichera condition

In the linear framework we can observe that the condition $\sigma \geq \alpha$ is optimal.

Optimality of $\sigma \geq \alpha$: the Fichera condition

In the linear framework we can observe that the condition $\sigma \ge \alpha$ is optimal. Indeed for linear equations as

$$a_{ij}\partial_{ij}^2 v + b_j v_j + cv = f$$
 in Ω

you can prescribe Dirichlet boundary data in the set

$$\Gamma_{d} = \left\{ x \in \partial\Omega : a_{ij}(x)\nu(x)\nu(x) > 0 \text{ or } \sum_{j} \left(b_{j} - \sum_{i} \partial_{x_{i}}a_{ij} \right)\nu_{j} > 0 \right\}$$

Assume that $c(x) \equiv 0$ in (E_{α}) and multiply the equation by d(x), hence we have:

$$-\alpha d(x)\Delta u + d(x)u + B(x)\cdot \nabla u - d(x)f(x) = 0$$
 in Ω .

Thus if $\sigma < \alpha$ our estimate should depend on the boundary value of u!

< ロ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

 $\bullet \quad -\alpha \,\Delta u + u + H(x, \nabla u) = 0 \quad \text{in } \Omega \,,$

• $-\alpha \Delta u + u + H(x, \nabla u) = 0$ in Ω , where H(x, p) satisfies a local natural growth condition, and general assumptions, as

$$egin{aligned} |\mathcal{H}(x,oldsymbol{p})-oldsymbol{p}\cdot\mathcal{H}_{oldsymbol{p}}(x,oldsymbol{p})|&\leq C_{0}|oldsymbol{p}|^{2}+rac{

As we saw, the most important role in such estimates is played by the singular transport term,

As we saw, the most important role in such estimates is played by the singular transport term, i.e. such estimates seem to be independent on the ellipticity of the operator.

As we saw, the most important role in such estimates is played by the singular transport term, i.e. such estimates seem to be independent on the ellipticity of the operator.

Question: are such kind of estimates stable with respect to the limit as $\alpha \rightarrow 0$?

< ロ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

As we saw, the most important role in such estimates is played by the singular transport term, i.e. such estimates seem to be independent on the ellipticity of the operator.

Question: are such kind of estimates stable with respect to the limit as $\alpha \rightarrow 0$?

In other words:

As we saw, the most important role in such estimates is played by the singular transport term, i.e. such estimates seem to be independent on the ellipticity of the operator.

Question: are such kind of estimates stable with respect to the limit as $\alpha \rightarrow 0$?

In other words:

are we able to prove the existence of a Lipschitz solution for the equation

$$(E_0) \qquad u + \frac{B(x) \cdot \nabla u}{d(x)} + c(x) |\nabla u|^2 = f(x) \qquad \text{in } \Omega \quad ?$$

< ロ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

As we saw, the most important role in such estimates is played by the singular transport term, i.e. such estimates seem to be independent on the ellipticity of the operator.

Question: are such kind of estimates stable with respect to the limit as $\alpha \rightarrow 0$?

In other words:

are we able to prove the existence of a Lipschitz solution for the equation

$$(E_0) \qquad u + \frac{B(x) \cdot \nabla u}{d(x)} + c(x) |\nabla u|^2 = f(x) \qquad \text{in } \Omega$$

In order to give a positive answer to such a question, we have to straight some hypotheses on the nonlinear term.

$$(E_0)$$
 $u + \frac{B(x) \cdot \nabla u}{d(x)} + c(x) |\nabla u|^2 = f(x)$ in Ω

$$(E_0)$$
 $u + \frac{B(x) \cdot \nabla u}{d(x)} + c(x) |\nabla u|^2 = f(x)$ in Ω

(ロ)

Two ingredients are needed:

$$(E_0)$$
 $u + \frac{B(x) \cdot \nabla u}{d(x)} + c(x) |\nabla u|^2 = f(x)$ in Ω

Two ingredients are needed:

 In order to get interior gradient bound c(x) has to be positive in Ω (possibly vanishing at ∂Ω);

$$(E_0)$$
 $u + \frac{B(x) \cdot \nabla u}{d(x)} + c(x) |\nabla u|^2 = f(x)$ in Ω

Two ingredients are needed:

- In order to get interior gradient bound c(x) has to be positive in Ω (possibly vanishing at ∂Ω);
- ► an approximation that involves a vanishing transport term i.e. the solutions of (*E*₀) are limit of

$$u - \alpha \Delta u + \alpha \frac{\nu \cdot \nabla u}{d(x)} + \frac{B(x) \cdot \nabla u}{d(x)} + c(x) |\nabla u|^2 = f(x) \quad \text{in } \Omega.$$

Theorem (T.L., A. Porretta - ARMA 2011)

Assume that $B(x) \in W^{1,\infty}(\Omega)^N$ is such that $B(x) \cdot \nu > 0$, and $f(x) \in W^{1,\infty}_{loc}(\Omega)$ satisfies near the boundary

$$|f| \leq rac{
ho(d)}{d}\,, \quad |
abla f| \leq rac{
ho(d)}{d^2} \qquad ext{where } \int_0^1 rac{
ho(s)}{s}\,ds < \infty\,.$$

Moreover suppose that $c(x) \in W^{1,\infty}_{loc}(\Omega)$ is a positive function that satisfies the following condition near $\partial \Omega$:

$$|\nabla c(x)|^2 \leq rac{
ho(d)}{d^2} c(x)$$

うして 山田 マイボット ボット シックション

Theorem (T.L., A. Porretta - ARMA 2011)

Assume that $B(x) \in W^{1,\infty}(\Omega)^N$ is such that $B(x) \cdot \nu > 0$, and $f(x) \in W^{1,\infty}_{loc}(\Omega)$ satisfies near the boundary

$$|f| \leq rac{
ho(d)}{d}\,, \quad |
abla f| \leq rac{
ho(d)}{d^2} \qquad ext{where } \int_0^1 rac{
ho(s)}{s}\,ds < \infty\,.$$

Moreover suppose that $c(x) \in W^{1,\infty}_{loc}(\Omega)$ is a positive function that satisfies the following condition near $\partial \Omega$:

$$|\nabla c(x)|^2 \leq rac{
ho(d)}{d^2} c(x)$$

Then there exists $u \in W^{1,\infty}(\Omega)$ which is a viscosity solution of (E_0) and $\frac{\partial u}{\partial \nu} = 0$ (in the viscosity sense) at $\partial \Omega$.

Application/motivation:

A stochastic control problem with state constraint.

A stochastic control problem with state constraint.

Let's go back to the model introduced by J.M. Lasry and P.L. Lions, and let us consider the SDE:

$$\left\{ egin{aligned} dX_t &= a_t dt + \sqrt{2} dB_t \ X_0 &= x \in \Omega \,. \end{aligned}
ight.$$

We have already noticed that the class of controls that confine the process inside Ω a.s. for any *t* is not empty.

A stochastic control problem with state constraint.

Let's go back to the model introduced by J.M. Lasry and P.L. Lions, and let us consider the SDE:

where $g(x) = \Delta S - S - |\nabla S|^q$.

The coefficients σ_k are chosen such that f(x) + g(x) is smooth.

Our aim is to prove a global Lipschitz estimate for *z*.

Indeed $z \in W^{1,\infty}(\Omega)$ implies that $|\nabla u - \nabla S|$ is bounded and we can characterize any singular term of ∇u ,

Indeed $z \in W^{1,\infty}(\Omega)$ implies that $|\nabla u - \nabla S|$ is bounded and we can characterize any singular term of ∇u , i.e. $\alpha = \frac{2-q}{q-1}$

$$\frac{\partial u(x)}{\partial \nu} - \frac{\alpha C^*}{d^{\alpha+1}(x)} + \sum_{k=1}^{[\alpha]+1} \left[\frac{(k-\alpha)\sigma_k(x)}{d^{\alpha-k+1}(x)} - \frac{\nabla \sigma_{k-1}(x) \cdot \nu}{d^{\alpha-k+1}(x)} \right] \in L^{\infty}(\Omega)$$

うしん 山下 (山下) (山下) (山下)

Indeed $z \in W^{1,\infty}(\Omega)$ implies that $|\nabla u - \nabla S|$ is bounded and we can characterize any singular term of ∇u , i.e. $\alpha = \frac{2-q}{q-1}$

$$\frac{\partial u(x)}{\partial \nu} - \frac{\alpha C^*}{d^{\alpha+1}(x)} + \sum_{k=1}^{[\alpha]+1} \left[\frac{(k-\alpha)\sigma_k(x)}{d^{\alpha-k+1}(x)} - \frac{\nabla \sigma_{k-1}(x) \cdot \nu}{d^{\alpha-k+1}(x)} \right] \in L^{\infty}(\Omega)$$

and

$$\frac{\partial u(x)}{\partial \tau} - \sum_{k=1}^{[\alpha]} \frac{\nabla \sigma_k(x) \cdot \tau}{d^{\alpha-k}(x)} \in L^{\infty}(\Omega)$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三■ - のへぐ

(that is a stronger result than the one stated).

Indeed $z \in W^{1,\infty}(\Omega)$ implies that $|\nabla u - \nabla S|$ is bounded and we can characterize any singular term of ∇u , i.e. $\alpha = \frac{2-q}{q-1}$

$$\frac{\partial u(x)}{\partial \nu} - \frac{\alpha C^*}{d^{\alpha+1}(x)} + \sum_{k=1}^{[\alpha]+1} \left[\frac{(k-\alpha)\sigma_k(x)}{d^{\alpha-k+1}(x)} - \frac{\nabla \sigma_{k-1}(x) \cdot \nu}{d^{\alpha-k+1}(x)} \right] \in L^{\infty}(\Omega)$$

and

$$\frac{\partial u(x)}{\partial \tau} - \sum_{k=1}^{[\alpha]} \frac{\nabla \sigma_k(x) \cdot \tau}{d^{\alpha-k}(x)} \in L^{\infty}(\Omega)$$

(that is a stronger result than the one stated). In particular it is easy to see that

$$\sigma_1 = \frac{(q-1)^{-\frac{2-q}{q-1}}}{3-2q} \frac{\Delta d(x)}{2}$$

and recalling that $\Delta d(x)\Big|_{\partial\Omega} = (N-1)H(x)$ we deduce the result of the Theorem.

Thus our aim is to prove a global Lipschitz estimate for the (unique) solution of

$$-\Delta z + z + |\nabla z + \nabla S|^q - |\nabla S|^q = f(x) + g(x)$$
 in Ω

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三■ - のへぐ

where the right hand side is smooth.

Thus our aim is to prove a global Lipschitz estimate for the (unique) solution of

$$-\Delta z + z + |\nabla z + \nabla S|^q - |\nabla S|^q = f(x) + g(x)$$
 in Ω

where the right hand side is smooth.

Actually, the first order expansion of the gradient ([PV]) implies that

$$|
abla z +
abla S|^q - |
abla S|^q \sim -rac{q}{q-1} \, rac{
abla z \cdot
abla d}{d} + H_0(x,
abla z) \, ,$$

where $H_0(x, p) = O(d^{\frac{2-q}{q-1}} |\nabla z|^2).$

Thus our aim is to prove a global Lipschitz estimate for the (unique) solution of

$$-\Delta z + z + |\nabla z + \nabla S|^q - |\nabla S|^q = f(x) + g(x)$$
 in Ω

where the right hand side is smooth.

Actually, the first order expansion of the gradient ([PV]) implies that

$$|
abla z +
abla S|^q - |
abla S|^q \sim -rac{q}{q-1} \, rac{
abla z \cdot
abla d}{d} + \mathcal{H}_0(x,
abla z) \, ,$$

where $H_0(x, p) = O(d^{\frac{2-q}{q-1}} |\nabla z|^2).$

Thus we are in the hypotheses of the previous Theorem. ■

Gracias!
